GOES-18 T2O Overview

Planning a 'split' Post Launch Test phase, beginning at 89.5°W and then drifting to 136.8°W in order to have early use of the GOES-18 Imager in the West location to mitigate the GOES-17 Imager thermal anomaly

During the Aug-Sept and Oct-Nov interleave periods, GOES-18 ABI data are at a "Provisional" level of maturity, fit for operational use and may be shared without restriction.

In between the interleave periods, GOES-18 ABI data should be treated as preliminary, non-operational data as some Post-Launch Testing will be occurring and GOES-17 carries the GOES-West designation.

GOES-17 ABI Loop Heat Pipe Anomaly – The Origin of Interleave and GOES-18 T2O Schedule

This plot shows daily maximum temperature of the ABI focal plane module. These maximums occur at night. The higher the temperature, the more saturated imagery becomes. Where the temperature rises to approach a black line for each band, marginal saturation may be observed in imagery. Where the temperature curve exceeds a black line for each band, the imagery may begin to saturate so much that it becomes unusable.
